

Electric Potential Difference Notes

- Potential is the key word. Here is some review from Gravitational Potential Energy.
 - **Gravitational Potential Energy** (PE) - energy stored due to its position (height) above the Earth.
 - **Formula:** $PE = mgh$
 - PE = Potential Energy
 - Unit: J
 - m = mass
 - Unit: kg
 - g = 9.8
 - Unit: m/s^2
 - h = height
 - Unit: m
 - **Formula:** $W = Fd$
 - W = work
 - Unit: J
 - F = force
 - Unit: N
 - d = displacement
 - Unit: m
 - **Formula:** $W = \Delta PE$
 - Work is equal to the change in Potential Energy
 - **Question:** If a weightlifter lifts a 275 kg mass 0.22 meters above his head, how much PE does the mass have?
 - Given: $m = 275 \text{ kg}$
 $H = 0.22 \text{ m}$
 $G = 9.8 \text{ m/s}^2$
 - Unknown: PE = ?
 - Equation: $PE = mgh$
 - Substitute: $PE = (275 \text{ kg})(9.8 \text{ m/s}^2)(0.22 \text{ m})$
 - Solve: PE = 593 J

- Here are some helpful symbols to keep in mind.

| Symbol | Description | Symbol | Description | Symbol | Description |
|--------|-------------------------|--------|-----------------------------|--------|--------------------------------|
| d | distance | g | acceleration due to gravity | PE_g | gravitational potential energy |
| E | electric field strength | h | height | q | charge |
| F_e | electromagnetic force | k | Coulomb's constant | U | electric potential energy |
| F_g | gravitational force | m | mass | μ | micro or 10^{-6} |

- Electric Potential Energy** - potential energy an electric charge has due to its location in an electric field

$$U = qEd$$

- Equation:

- U = electric potential energy
 - Unit: Joule (J)
- Q = electric charge
 - Unit: C
- E = electric field
 - Unit: N/C
- D = distance from electric charge to source of electric field
 - Unit: m

- The further away the electric charge is from the source of the field, the more Electric Potential Energy it has
- Question:** A point charge of $5.0 \mu\text{C}$ is placed at a distance of 0.08 m from a hard rubber rod with an electric field of 1.0×10^3 . What is the electric potential energy of the point charge?
 - Given: $q = 5.0 \mu\text{C} = 5.0 \times 10^{-6} \text{ C}$
 $d = 0.08 \text{ m}$
 $E = 1.0 \times 10^3 \text{ N/C}$
 - Unknown: $U = ?$
 - Equation: $U = qEd$
 - Substitute: $U = (5.0 \times 10^{-6} \text{ C})(1.0 \times 10^3 \text{ N/C})(d = 0.08 \text{ m})$
 - Solve: $U = 4.0 \times 10^{-4} \text{ J}$

- **Question:** What is the electric potential energy of the point charge at 1.3 m?
 - Given: $q = 5.0 \mu\text{C} = 5.0 \times 10^{-6} \text{ C}$
 $d = 0.08 \text{ m}$
 $E = 1.0 \times 10^3 \text{ N/C}$
 - Unknown: $U = ?$
 - Equation: $U = qEd$
 - Substitute: $U = (5.0 \times 10^{-6} \text{ C})(1.0 \times 10^3 \text{ N/C})(d = 0.08 \text{ m})$
 - Solve: $U = 4.0 \times 10^{-4} \text{ J}$
- Electric potential - electric potential energy of a charged particle divided by its charge
 - Electric potential tells you how strong an electric field is at a given spot

$$V = \frac{U}{q}$$

- **Equation:**
 - $V =$ electric potential
 - Unit: Volt (V)
 - $U =$ electric potential energy
 - Unit: J
 - $q =$ electric charge
 - Unit: C
- **Question:** A hard rubber rod with an electric potential energy of $4.9 \times 10^{-3} \text{ J}$ has a charge of $3.0 \mu\text{C}$ at the tip. What is the electric potential at the tip? Round your answer to one decimal place.
 - Given: $U = 4.9 \times 10^{-3} \text{ J}$
 $q = 3.0 \mu\text{C} = 3.0 \times 10^{-6} \text{ C}$
 - Unknown: $V = ?$
 - Equation: $V = \frac{U}{q}$
 - Substitute: $V = \frac{4.9 \times 10^{-3} \text{ J}}{3.0 \times 10^{-6} \text{ C}}$
 - Solve: $V = 1.6 \times 10^3 \text{ V}$
- **Question:** What is the electric potential if the charge at the tip changes to $2.0 \mu\text{C}$? Round your answer to one decimal place.
 - Given: $U = 4.9 \times 10^{-3} \text{ J}$
 $q = 2.0 \mu\text{C} = 2.0 \times 10^{-6} \text{ C}$
 - Unknown: $V = ?$
 - Equation: $V = \frac{U}{q}$
 - Substitute: $V = \frac{4.9 \times 10^{-3} \text{ J}}{2.0 \times 10^{-6} \text{ C}}$
 - Solve: $V = 2.5 \times 10^3 \text{ V}$

$$V = k \frac{q}{d}$$

- **Equation:**
 - V = electric potential
■ Unit: V
 - $k = 8.99 \times 10^9$
 - q = electric charge
■ Unit: C
 - d = distance between electric charge and source of electric field
■ Unit: m
- **Question:** What is the electric potential of a $2.2 \mu\text{C}$ charge at a distance of 6.3 m from the charge? Recall that Coulomb's constant is $k = 8.99 \times 10^9$.
 - Given: $q = 2.2 \mu\text{C} = 2.2 \times 10^{-6} \text{ C}$
 $d = 6.3 \text{ m}$
 $k = 8.99 \times 10^9$
 - Unknown: $V = ?$
 - Equation: $V = k \frac{q}{d}$
 - Substitute: $V = (8.99 \times 10^9) \left(\frac{2.2 \times 10^{-6} \text{ C}}{6.3 \text{ m}} \right)$
 - Solve: $V = 3140 \text{ V}$
- **Question:** What is the electric potential at a distance of 99 m from the charge?
 - Given: $q = 2.2 \mu\text{C} = 2.2 \times 10^{-6} \text{ C}$
 $d = 99 \text{ m}$
 $k = 8.99 \times 10^9$
 - Unknown: $V = ?$
 - Equation: $V = k \frac{q}{d}$
 - Substitute: $V = (8.99 \times 10^9) \left(\frac{2.2 \times 10^{-6} \text{ C}}{99 \text{ m}} \right)$
 - Solve: $V = 200 \text{ V}$
- **Electric potential difference** - the difference in electric potential between two spots
 - A.k.a. Voltage
- **Question:** The magnitude of the electric field between two parallel charged plates is 800.0 N/C . An electron moves to the negative plate 2.5 cm away. Find the electric potential difference and the work. Recall that the charge of an electron is $1.602 \times 10^{-19} \text{ C}$.
 - Given: $E = 800.0 \text{ N/C}$
 $d = 2.5 \text{ cm} = 0.025 \text{ m}$
 $q = 1.602 \times 10^{-19} \text{ C}$
 - Unknown: ΔV and W
 - Equations: $\Delta V = Ed$ and $W = q \Delta V$

- Substitute: $\Delta V = (800.0 \text{ N/C})(0.025 \text{ m})$ and $W = (1.602 \times 10^{-19} \text{ C})\Delta V$
- Solve: $\Delta V = 20 \text{ V}$ and $W = (1.602 \times 10^{-19} \text{ C})(20 \text{ V}) = 3.2 \times 10^{-19} \text{ J}$
